How do I design a photovoltaic and solar hot water system?

Provide an architectural drawing and riser diagram for the homeowner showing the planned location for future photovoltaic and solar hot water system components. Space requirements and layout for photovoltaic and solar water heating system components should be taken into account early in the design process.

What makes a good solar panel array layout?

A well-designed array layout is integral to the performance, efficiency, and longevity of your solar installation. A solar panel array can be wired in series or parallel, depending on the desired voltage and current output.

Should I choose a string inverter or a micro-inverter solar panel layout?

Choosing between a string inverter and a micro-inverter solar panel layout will also impact your array design. A string inverter system connects solar panels in series, forming a string. These strings are then connected to a single centralized inverter, which converts direct current (DC) to alternating current (AC) for use in your home or business.

How do I choose the right roof for my solar panel array?

Selecting the right rooftop for your solar panel array is a pivotal decision that requires careful consideration. The choice of roof impacts the system's performance, longevity, and overall return on investment. Orientation refers to the direction your roof faces in relation to the sun.

What are solar photovoltaic modules?

Solar photovoltaic modules are where the electricity gets generated, but are only one of the many parts in a complete photovoltaic (PV) system. In order for the generated electricity to be useful in a home or business, a number of other technologies must be in place.
