Are solar panels durable?

Solar panels are generally very durable. Most solar panels are designed and tested to withstand the elements like hail, high winds, and heavy snow loads. And thanks to their lack of moving parts, solar panel systems usually require little to no maintenance. Still, maintaining your solar panels can boost production.

Do solar panels stop working after 25 years?

After 25 years, solar panels will be less efficient and produce less power. This doesn't mean your solar panels will stop working, but they may be less effective at powering your home and lowering your energy savings. When panels degrade to the point where they no longer produce power, they're ready to be recycled.

Do solar panels expire?

There is technically no expiration date on solar panels. However, over time, they naturally tend to become less efficient at producing energy. Some panels can also break due to physical damage from extreme weather conditions.

How often should solar panels be replaced?

One way to keep your solar system operating at its peak is to sync up your roof maintenance with solar panel maintenance and replacement. Depending on roof shingle types, a typical roof needs to be replaced about every 25 years, which is the perfect time to potentially replace your solar panels.

How bad are solar panels?

NREL's findings indicate that solar panels have an average degradation rate of 0.5% per year. So if your solar panels have been operational for five years, your power generation will be 2.5% lower than your initial output. If we apply this to 20-year-old panels, production drops to 90% of the original output.

How much do solar panels deteriorate a year?

The National Renewable Energy Laboratory (NREL) has been tracking degradation rates for the last several years as part of its Photovoltaic (PV) Lifetime Project. NREL's findings indicate that solar panels have an average degradation rate of 0.5% per year.
