What are the different types of PV electricity calculation used in Global Solar Atlas?

There are several variants of PV electricity calculation used in Global Solar Atlas. Theoretical is used for site prospection on "Site Data" tab. It uses generalized theoretical settings for a quick assessment of PV power potential for the selected site.

What are photovoltaic panels & how do they work?

They are designed for builders constructing single family homes with pitched roofs, which offer adequate access to the attic after construction. It is assumed that aluminum framed photovoltaic (PV) panels mounted on a "post" and rail mounting system, the most common in the industry today, will be installed by the homeowner.

How do you calculate the number of photovoltaic modules?

Multiplying the number of modules required per string (C10) by the number of strings in parallel (C11) determines the number of modules to be purchased. The rated module output in watts as stated by the manufacturer. Photovoltaic modules are usually priced in terms of the rated module output (\$/watt).

How do you calculate the cost of a photovoltaic array?

Photovoltaic modules are usually priced in terms of the rated module output (\$/watt). Multiplying the number of modules to be purchased (C12) by the nominal rated module output (C13) determines the nominal rated array output. This number will be used to determine the cost of the photovoltaic array.
